

Website Name | FinLit

FinLit is a financial literacy platform designed to help users understand major areas of finance through structured, interactive learning. The platform organizes content into broad financial domains, allowing users to explore finance at both high and granular levels. Each domain contains a complete tree of modules and submodules that explain key concepts, terminology, and real-world applications. Learning modules include practical examples that demonstrate how financial concepts apply to everyday decisions and professional environments. The goal of FinLit is to make complex financial topics more approachable, engaging, and relevant through clear organization, progress tracking, and real-life context.

Page Structure

The primary pages of the website include:

1. **Home**, which introduces the platform, explains its purpose, and highlights the available finance areas.
2. **Learning Hub** provides a view of all financial domains, the full module tree, and user progress.
3. **Module Content**, which presents material for a selected module, including explanations and real examples.
4. **Finance Glossary**, page for financial terms, definitions, and key equations used throughout the platform.
5. **Markets and Resources**, which connect platform content to real financial markets, news outlets, and external learning resources.

Client-Side JavaScript Usage

Client-side JavaScript will be used to add interactivity and engagement throughout the FinLit platform. Users will be able to expand and collapse finance domains and modules within the learning hub to improve navigation. Selecting a module will dynamically load its content without requiring a full-page refresh. JavaScript will also support interactive real-life examples, such as simple decision-based scenarios where users choose between financial options and immediately see outcomes. Progress indicators will update in real time as users complete modules and interact with learning content.

Data Storage, Manipulation, and Viewing

The server-side component of FinLit will store educational content and user progress data persistently. Financial domains will be stored with information such as name and description. At the same time, modules and submodules will include details such as title, associated domain, difficulty level, summary, detailed content, and display order. User accounts will be used to track learning progress across the entire module tree, including completion status, last viewed module, and timestamps.

As users complete modules or interact with scenario-based examples, their progress data will be updated and saved. This allows users to return to the platform and continue learning where they left off while viewing their overall progress across all areas of finance. Administrative users will be able to manage and update educational content to keep material current.
